

# Intro to Quantum Physics F3241

Dr Lily Asquith (Lily)

Week 3

# Blackbody Radiation

This week's topics:

## 3.1 Blackbody Radiation

## 3.2 The Ultraviolet Catastrophe, Planck to the rescue

Your homework questions for this week are on canvas - please complete these by the end of the week.

# Temperature: observations

Let's do a quiz: [pollev.com/ilovephysics](https://pollev.com/ilovephysics)

# Wien's Law & Stefan-Boltzman Law

The Peak Wavelength  $\lambda_P \sim T^{-1}$ .

Wien's law:  $\lambda_P = \sigma T^{-1}$ , where  $\sigma = 2.90 \times 10^{-3}$  [units?]

The Peak Power Density  $R_P \sim T^4$ .

Stefan-Boltzman Law:  $R_P = kT^4$ , where  $k = 5.67 \times 10^8 \text{ Wm}^{-2}$

Note that astronomers use really silly units.

# Silly Astronomers

From Wikipedia: Radiant intensity with a page search for "confusing":

Radiance	$L_{e,\Omega}$ <sup>[nb 5]</sup>	watt per steradian per square metre	$\text{W}\cdot\text{sr}^{-1}\cdot\text{m}^{-2}$	$\text{M}\cdot\text{T}^{-3}$	Radiant flux emitted, reflected, transmitted or received by a <i>surface</i> , per unit solid angle per unit projected area. This is a <i>directional</i> quantity. This is sometimes also <b>confusingly</b> called "intensity".
Spectral radiance	$L_{e,\Omega,\nu}$ <sup>[nb 3]</sup>	watt per steradian per square metre per hertz	$\text{W}\cdot\text{sr}^{-1}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$	$\text{M}\cdot\text{T}^{-2}$	Radiance of a <i>surface</i> per unit frequency or wavelength. The latter is commonly measured in $\text{W}\cdot\text{sr}^{-1}\cdot\text{m}^{-2}\cdot\text{nm}^{-1}$ . This is a <i>directional</i> quantity. This is sometimes also <b>confusingly</b> called "spectral intensity".
	$L_{e,\Omega,\lambda}$ <sup>[nb 4]</sup>	watt per steradian per square metre, per metre	$\text{W}\cdot\text{sr}^{-1}\cdot\text{m}^{-3}$	$\text{M}\cdot\text{L}^{-1}\cdot\text{T}^{-3}$	
Irradiance Flux density	$E_e$ <sup>[nb 2]</sup>	watt per square metre	$\text{W}/\text{m}^2$	$\text{M}\cdot\text{T}^{-3}$	Radiant flux <i>received</i> by a <i>surface</i> per unit area. This is sometimes also <b>confusingly</b> called "intensity".
Spectral irradiance Spectral flux density	$E_{e,\nu}$ <sup>[nb 3]</sup>	watt per square metre per hertz	$\text{W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$	$\text{M}\cdot\text{T}^{-2}$	Irradiance of a <i>surface</i> per unit frequency or wavelength. This is sometimes also <b>confusingly</b> called "spectral intensity". Non-SI units of spectral flux density include <b>jansky</b> (1 Jy = $10^{-26} \text{ W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$ ) and <b>solar flux unit</b> (1 sfu = $10^{-22} \text{ W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$ = $10^4$ Jy).
	$E_{e,\lambda}$ <sup>[nb 4]</sup>	watt per square metre, per metre	$\text{W}/\text{m}^3$	$\text{M}\cdot\text{L}^{-1}\cdot\text{T}^{-3}$	
Radiosity	$J_e$ <sup>[nb 2]</sup>	watt per square metre	$\text{W}/\text{m}^2$	$\text{M}\cdot\text{T}^{-3}$	Radiant flux <i>leaving</i> (emitted, reflected and transmitted by) a <i>surface</i> per unit area. This is sometimes also <b>confusingly</b> called "intensity".
Spectral radiosity	$J_{e,\nu}$ <sup>[nb 3]</sup>	watt per square metre per hertz	$\text{W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$	$\text{M}\cdot\text{T}^{-2}$	Radiosity of a <i>surface</i> per unit frequency or wavelength. The latter is commonly measured in $\text{W}\cdot\text{m}^{-2}\cdot\text{nm}^{-1}$ . This is sometimes also <b>confusingly</b> called "spectral intensity".
	$J_{e,\lambda}$ <sup>[nb 4]</sup>	watt per square metre, per metre	$\text{W}/\text{m}^3$	$\text{M}\cdot\text{L}^{-1}\cdot\text{T}^{-3}$	
Radiant exitance	$M_e$ <sup>[nb 2]</sup>	watt per square metre	$\text{W}/\text{m}^2$	$\text{M}\cdot\text{T}^{-3}$	Radiant flux <i>emitted</i> by a <i>surface</i> per unit area. This is the emitted component of radiosity. "Radiant emittance" is an old term for this quantity. This is sometimes also <b>confusingly</b> called "intensity".
Spectral exitance	$M_{e,\nu}$ <sup>[nb 3]</sup>	watt per square metre per hertz	$\text{W}\cdot\text{m}^{-2}\cdot\text{Hz}^{-1}$	$\text{M}\cdot\text{T}^{-2}$	Radiant exitance of a <i>surface</i> per unit frequency or wavelength. The latter is commonly measured in $\text{W}\cdot\text{m}^{-2}\cdot\text{nm}^{-1}$ . "Spectral emittance" is an old term for this quantity. This is sometimes also <b>confusingly</b> called "spectral intensity".
	$M_{e,\lambda}$ <sup>[nb 4]</sup>	watt per square metre, per metre	$\text{W}/\text{m}^3$	$\text{M}\cdot\text{L}^{-1}\cdot\text{T}^{-3}$	

# Energy Density: The Rayleigh-Jeans law

We can understand the blackbody spectrum in pieces, but what about the whole thing?

$$\text{R-J Law: } U(T) = \frac{8\pi}{\lambda^4} k_B T$$

where

$$k_B = 1.38 \times 10^{-23} \text{ JK}^{-1}$$

Let's analyse this...

# The UV catastrophe: Aargh!

Classical Physics has failed us!

$$\text{R-J Law: } U(T) = \frac{8\pi}{\lambda^4} k_B T$$

where

$$k_B = 1.38 \times 10^{-23} \text{ JK}^{-1}$$

Let's analyse this...

# Relating Frequency, Wavelength, Speed

The wavelength  $\lambda$

The frequency  $f$

The speed  $c$

# Planck's "Solution"

R-J Law:  $U(T) = \frac{8\pi}{\lambda^4} k_B T$

Does not agree with countless observations

The theory (classical) to be modified somehow if it is to describe the data

Planck found that if he insisted **the energy only take discrete values**, he got this modification for free.

Allowed Energy  $E = [\text{some integer } n] \times [\text{some constant } h] \times [\text{frequency}]$

Planck Law:  $U(T) = \frac{8\pi}{\lambda^4} \frac{hc}{\lambda(e^{(hc/\lambda)k_B T} - 1)}$

This Planck formula of the 'energy density' perfectly matched the observations, and solved the UV catastrophe.

# Allowed Energies

Allowed Energy  $E = [n] \times [h] \times [f] = [n] \times [h] \times \left[ \frac{c}{\lambda} \right]$

Consider three wavelengths of em radiation:

10 m (radio)

500 nm (visible light)

100 pm (x-ray)

If  $hc = 1240 \text{ eV nm}$ , what is the smallest ( $n = 1$ ) allowed energy in eV?

## Note!

Planck did not think his restriction of Energies using  $E=nhf$  was anything more than a mathematical trick.

It was Einstein who realised the physical importance of this, and coined the term 'Planck's constant' for  $h$ .
